**Space and Shape**  
with the  
**Tangram Puzzle**

The Hands-on Approach  
Student Booklet

**Volume 1**

## Recognition and Visualisation Exercises

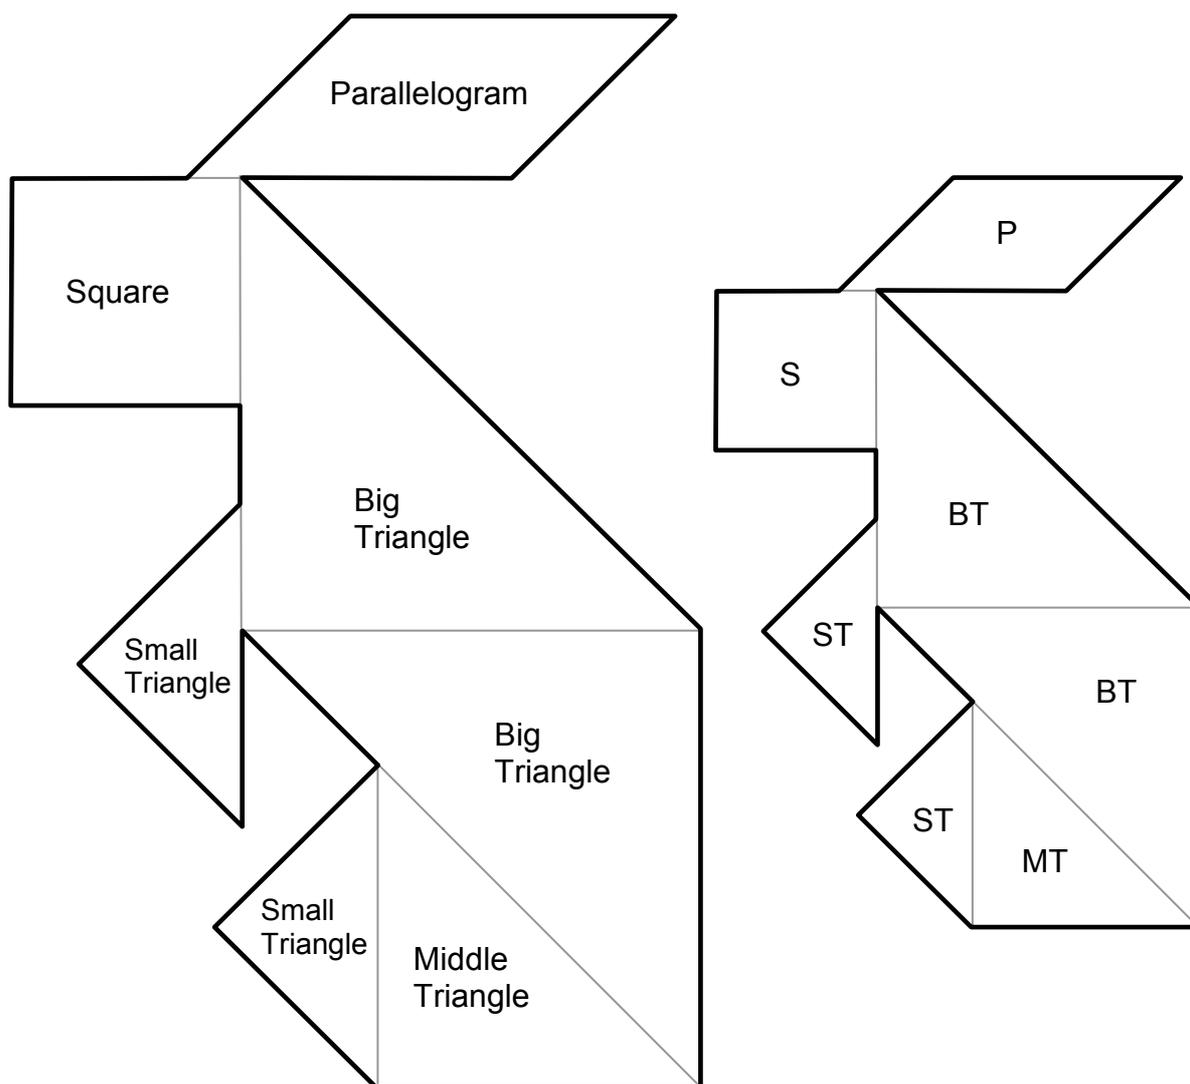

First form the shape shown below using the 7 Tangram pieces. Then, using a ruler and a pencil, draw in the missing lines to show each piece. Next write the name of the figure inside its shape.

Instead of writing the name in full, you may want to abbreviate the words:

For square write S. For parallelogram write P. Small triangle can be written as ST. The middle triangle could be written as MT and finally the large triangle as LT.

Note: You may place the pieces on the shape below and then remove them before drawing in the lines.

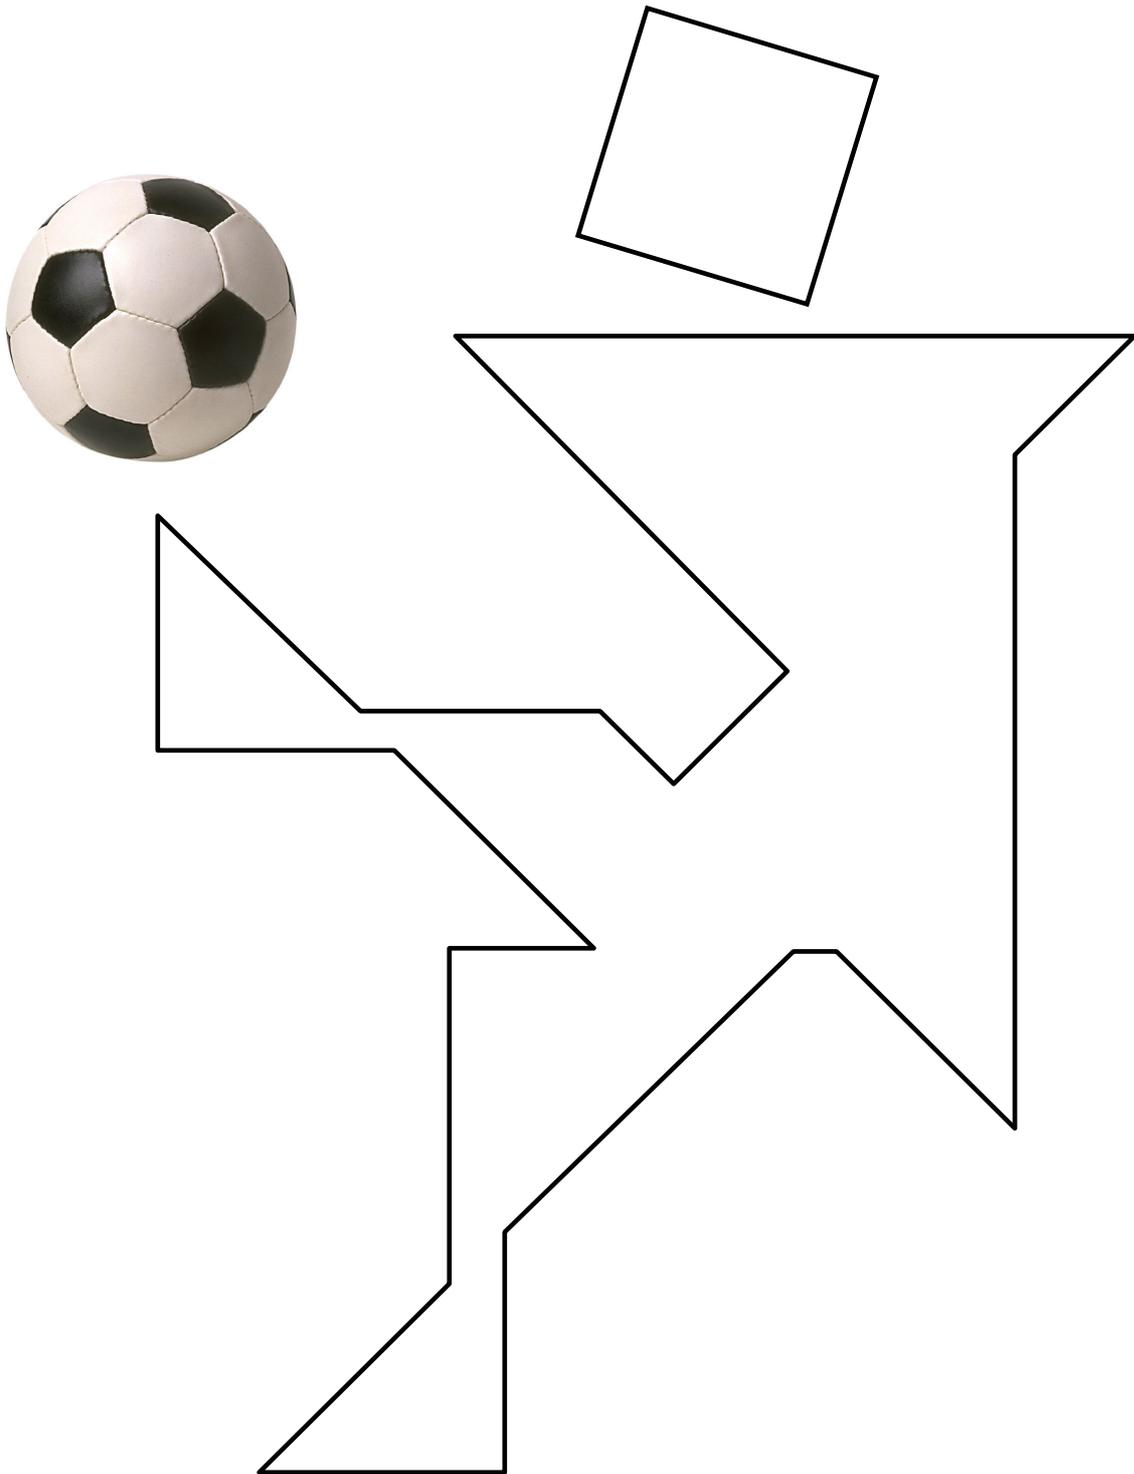

Below is an example.

## Exercise 1

First form the shape shown below using the 7 Tangram pieces. Then, using a ruler and a pencil, draw in the missing lines to show each piece. Next write the name of the figure inside its shape.

Note: You may place the pieces on the shape below and then remove them before drawing in the lines.

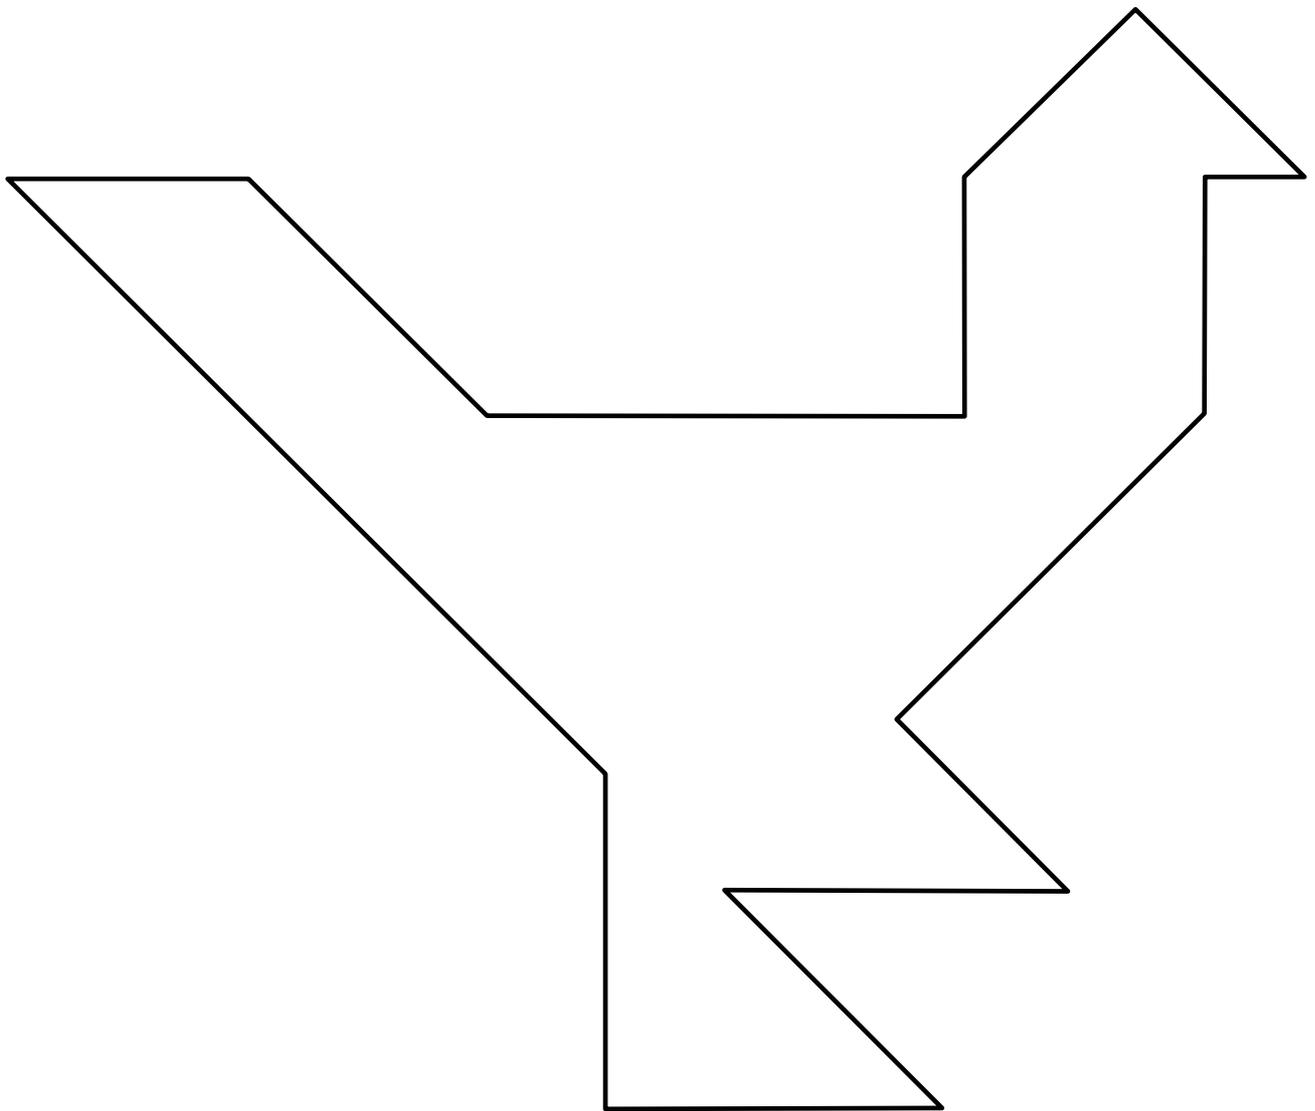

Soccer Player

## Exercise 2

First form the shape shown below using the 7 Tangram pieces. Then, using a ruler and a pencil, draw in the missing lines to show each piece. Next write the name of the figure inside its shape.

Note: You may place the pieces on the shape below and then remove them before drawing in the lines.

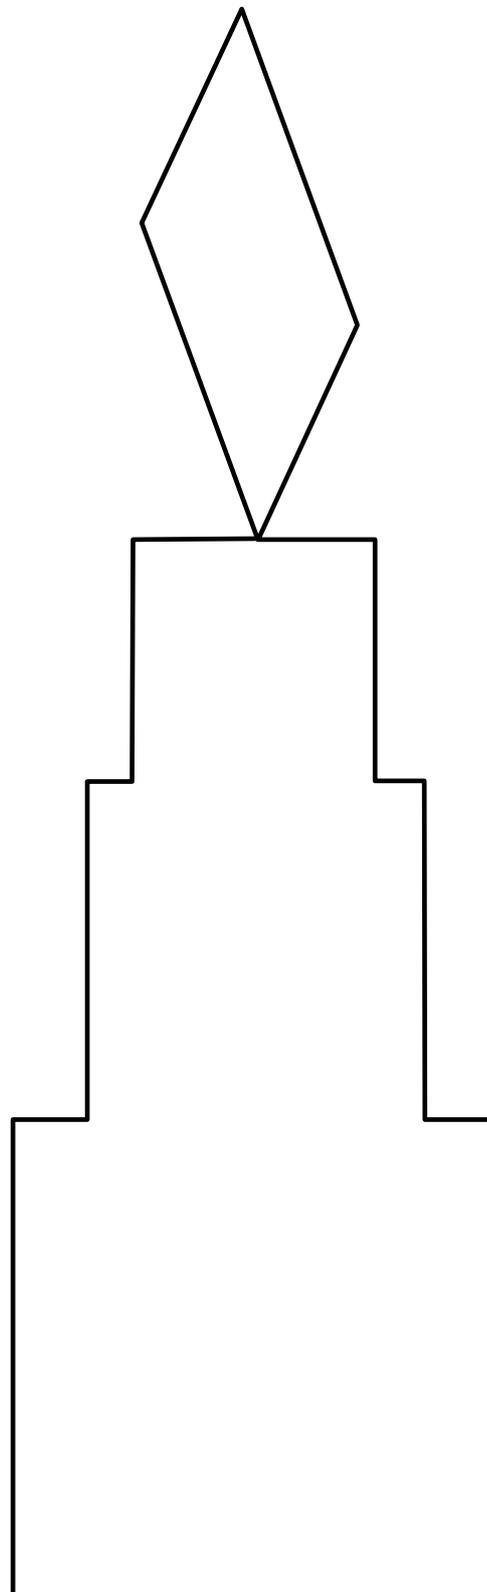

Chicken

### Exercise 3

First form the shape shown below using the 7 Tangram pieces.

Then, using a ruler and a pencil, draw in the missing lines to show each piece. Next write the name of the figure inside its shape.

Note: You may place the pieces on the shape below and then remove them before drawing in the lines.

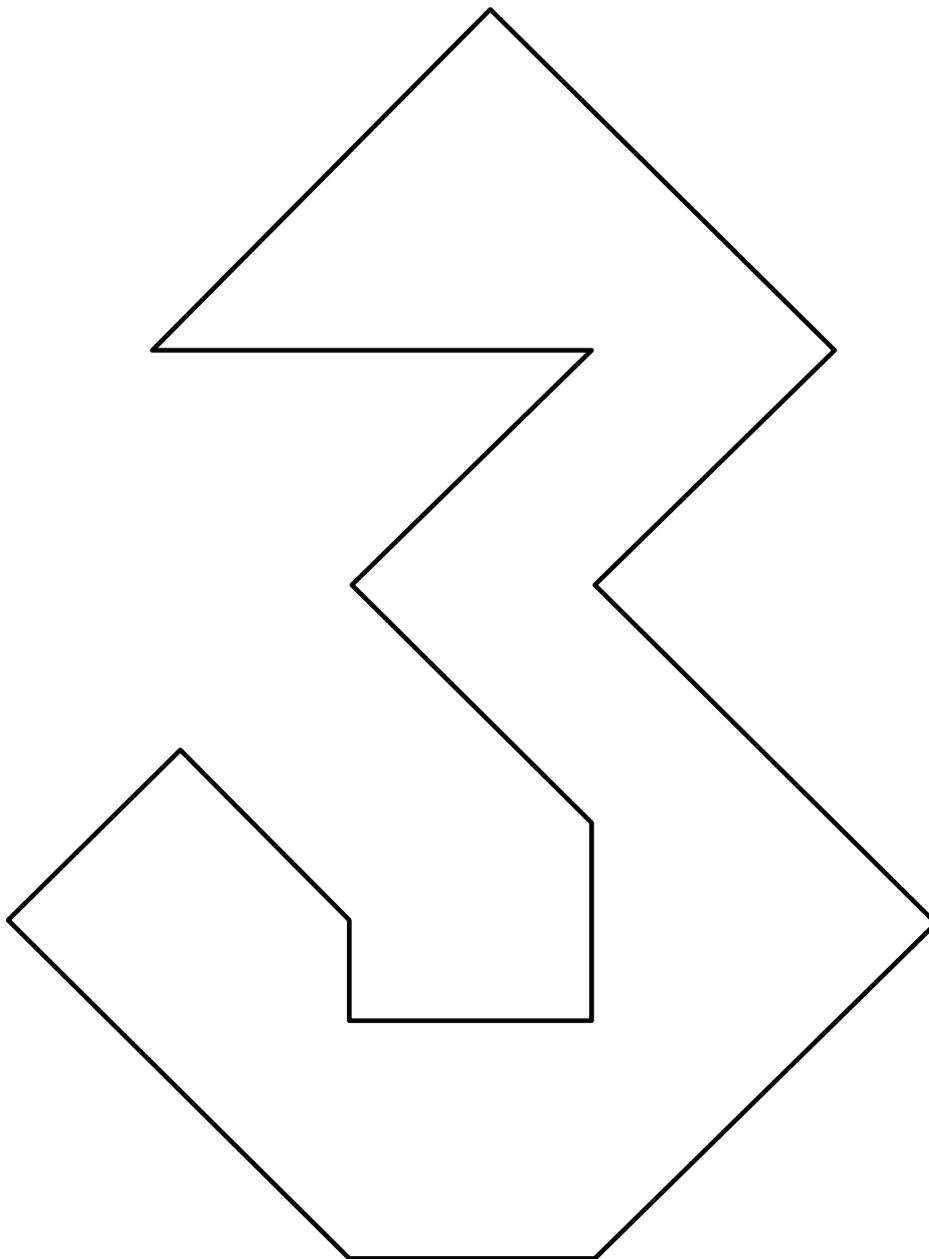

Candle and Flame

### Exercise 4

First form the shape shown below using the 7 Tangram pieces. Then, using a ruler and a pencil, draw in the missing lines to show each piece. Next write the name of the figure inside its shape.

Note: You may place the pieces on the shape below and then remove them before drawing in the lines.

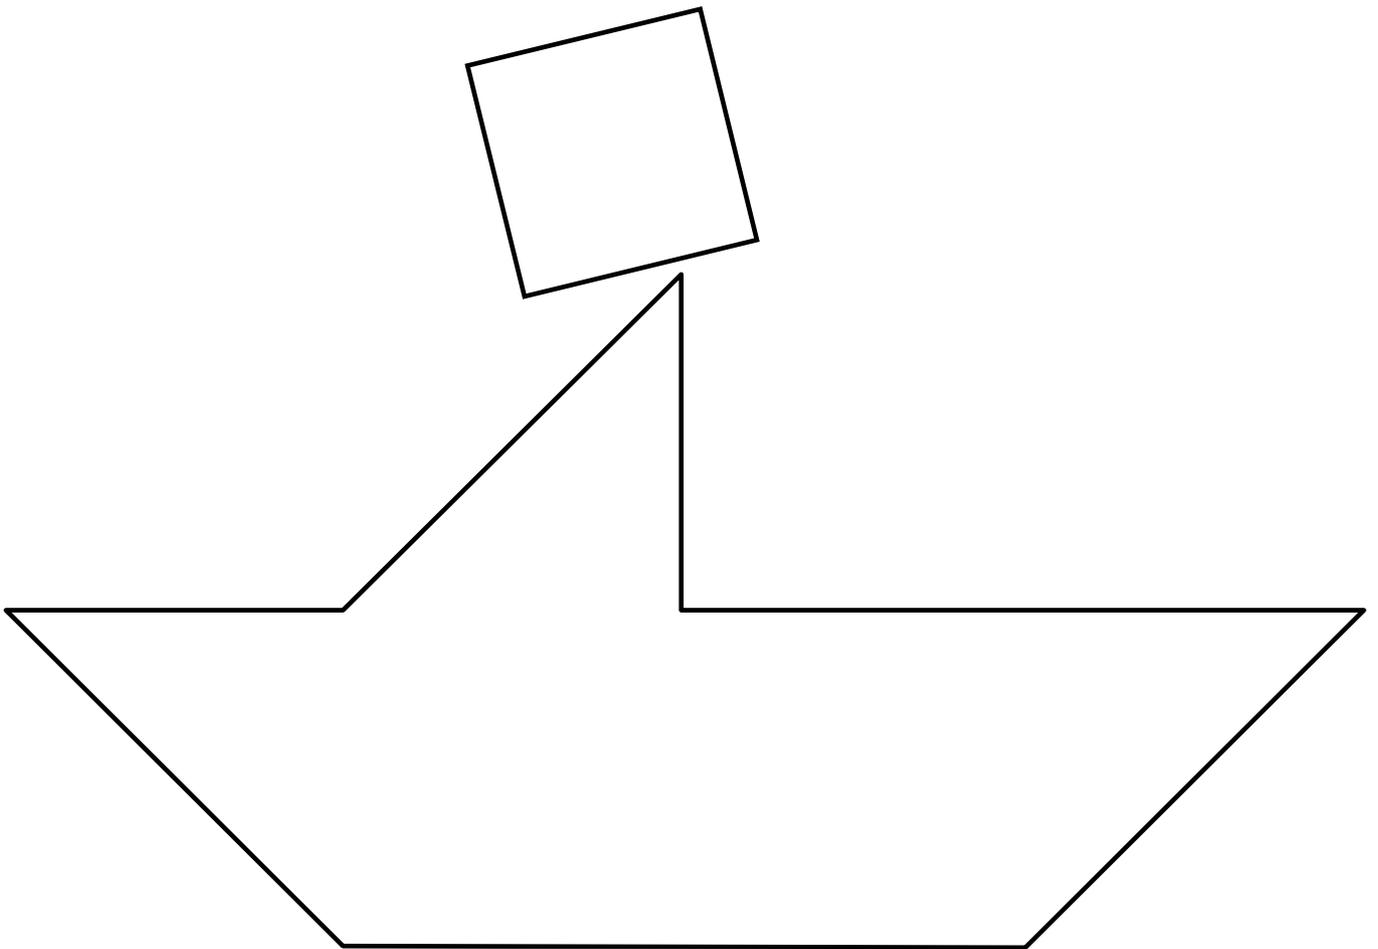

Number 3

### Exercise 5

First form the shape shown below using the 7 Tangram pieces. Then, using a ruler and a pencil, draw in the missing lines to show each piece. Next write the name of the figure inside its shape.

Note: You may place the pieces on the shape below and then remove them before drawing in the lines.

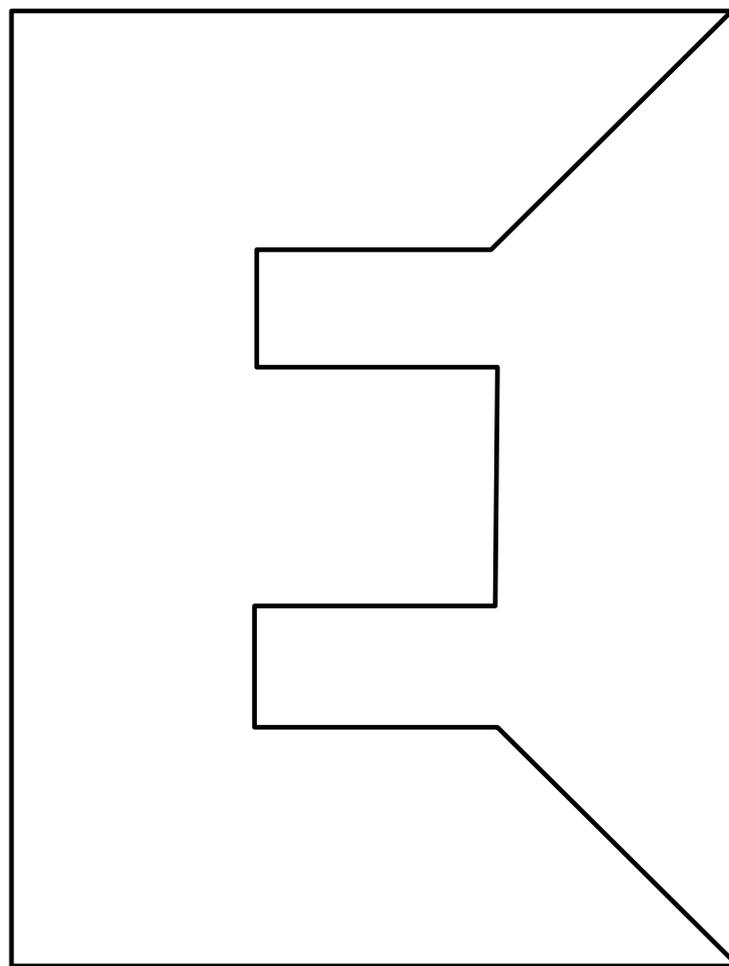

Person in Boat

## Exercise 6

First form the shape shown below using the 7 Tangram pieces. Then, using a ruler and a pencil, draw in the missing lines to show each piece. Next write the name of the figure inside its shape.

Note: You may place the pieces on the shape below and then remove them before drawing in the lines.

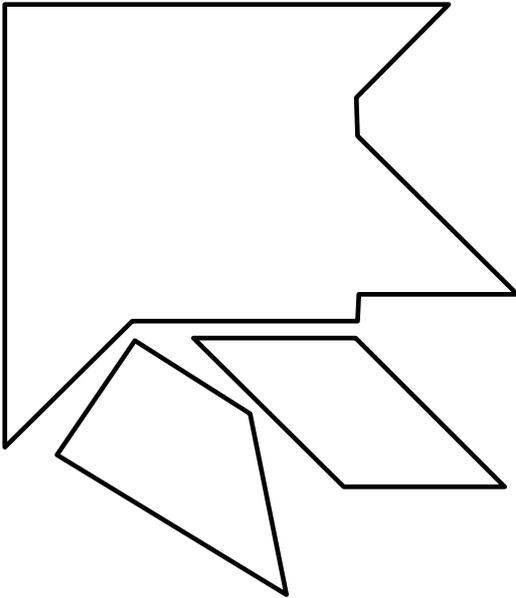

Letter E

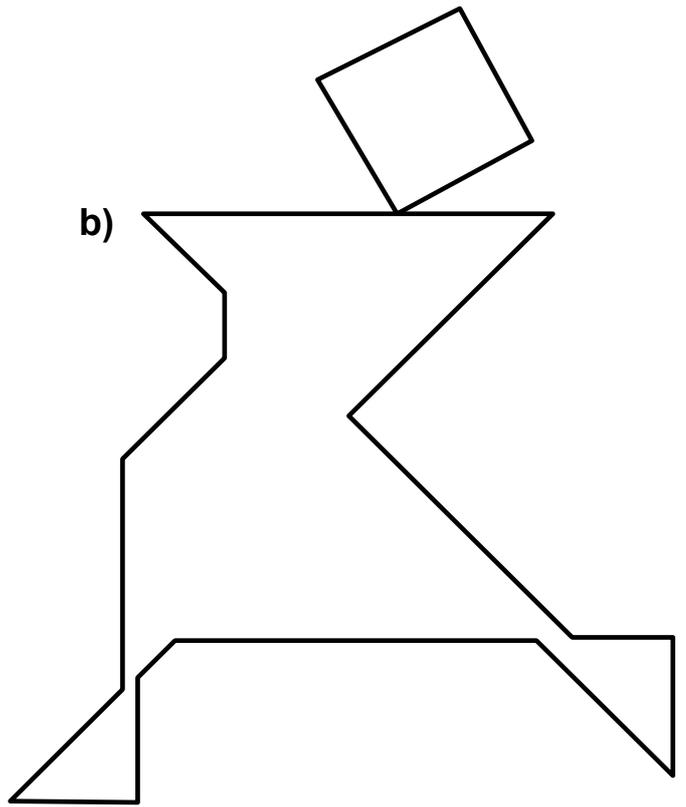

## Exercise 7

Draw in the missing lines without the help of the Tangram pieces.

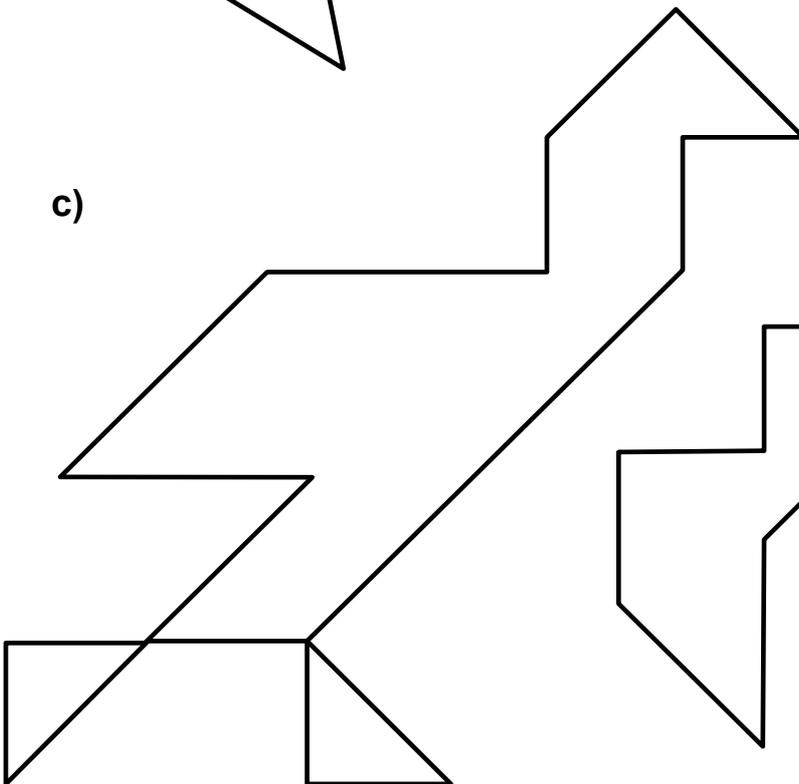

a)

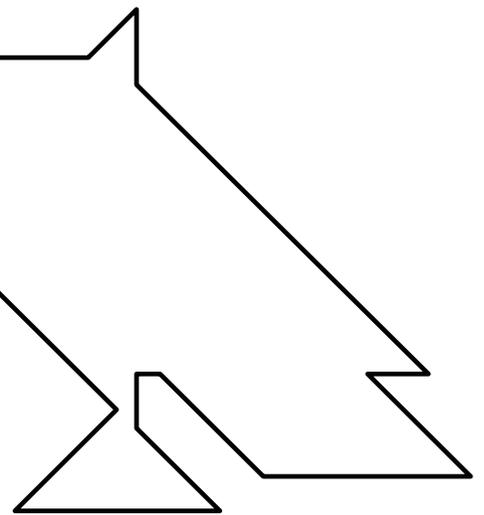

b)

c)

d)

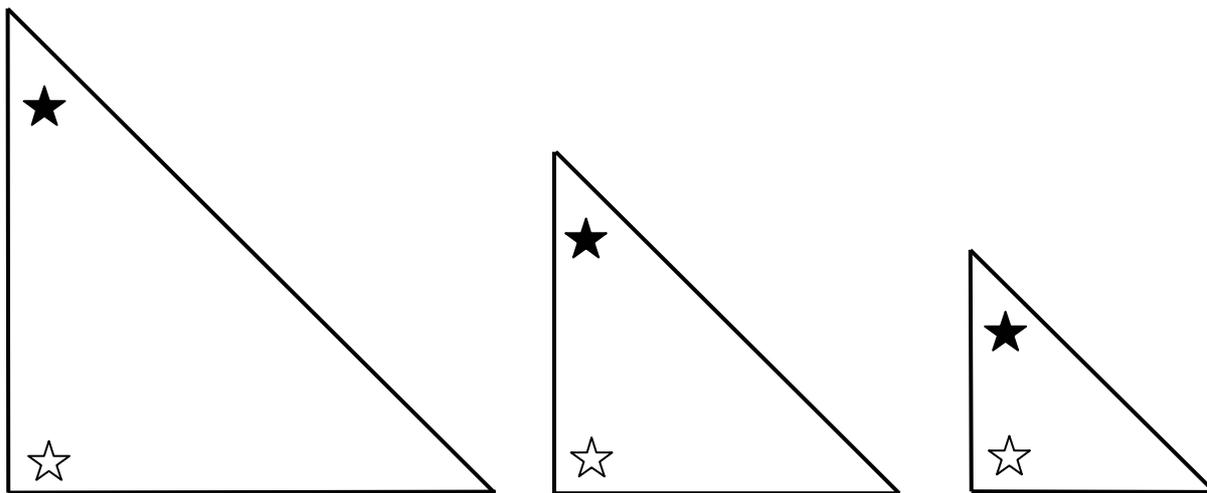

Hints: Figures: a, b and c can be done with 4 lines; figure d can be done with 6 lines.

## Exercise 8 Lines and Angles of Triangles

When two lines meet each other an angle is formed. The point where the lines meet is called the vertex. (The plural of vertex is vertices).

How many sides does a triangle have? \_\_\_\_ How many angles? \_\_\_\_

Place three triangles over the outlines and then answer the questions that follow.

1. What is the size of ☆? \_\_\_\_\_

2. How can we show that they are all the same size?

\_\_\_\_\_

3. What is the size of ★? \_\_\_\_\_

4. How can we show that they are all the same size?

\_\_\_\_\_

5. What are the sizes of the unmarked angles? \_\_\_\_\_

6. What is the common feature of all three triangles shown above?

\_\_\_\_\_

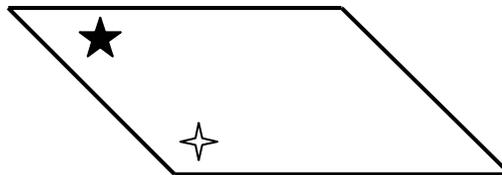

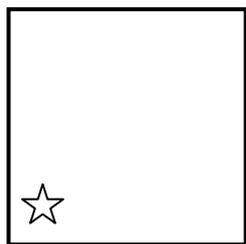

7. What do you notice about the two shorter sides of each triangle?

\_\_\_\_\_

8. We call these triangles, \_\_\_\_\_ triangles.

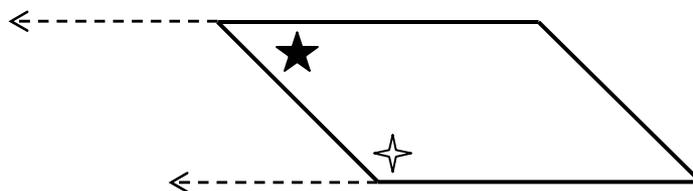

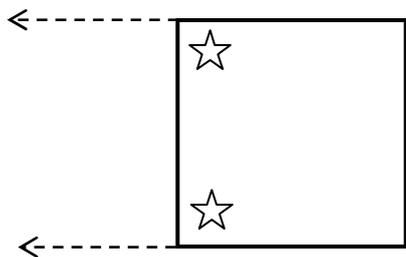

### Exercise 9 Lines and Angles of the Square and Parallelogram

Place the square and parallelogram over the outlines.

1. What is the size of ☆? \_\_\_\_\_
2. What are the other three angles of the square equal to? \_\_\_\_\_
3. What is the size of ★? \_\_\_\_\_
4. What is the size of ✧? \_\_\_\_\_
5. What are the other two angles equal to? \_\_\_\_\_
6. How can we show this using the Tangram piece and the outline?  
\_\_\_\_\_

7. If we extend the opposite sides or lines of the square and parallelogram as shown below, would they meet? \_\_\_\_\_

8. These pairs of lines are called \_\_\_\_\_
9. What is the answer if we add ☆ and ☆? \_\_\_\_\_
10. What is the answer if we add ★ and ✧? \_\_\_\_\_

11. If we had  what would the size of ☆ be? \_\_\_\_\_

## The Names of Angles

Any angle between  $0^\circ$  to  $90^\circ$  is called an **acute angle**.

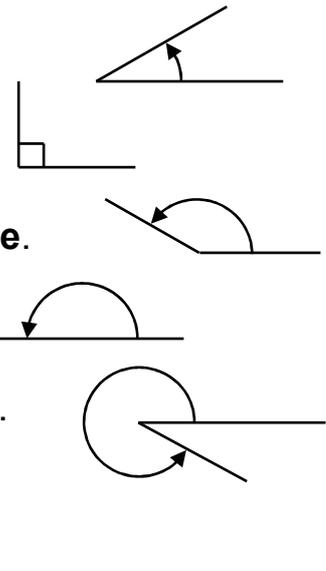

An angle of  $90^\circ$  is called a **right angle**.

Any angle between  $90^\circ$  to  $180^\circ$  is called an **obtuse angle**.

An angle of  $180^\circ$  is called a **straight angle**. (Why?)

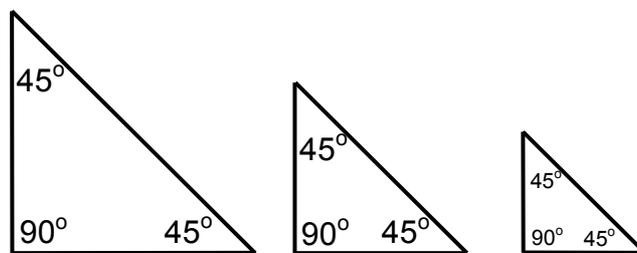

Any angle between  $180^\circ$  to  $360^\circ$  is called a **reflex angle**.

An angle of  $360^\circ$  is called a **revolution**.

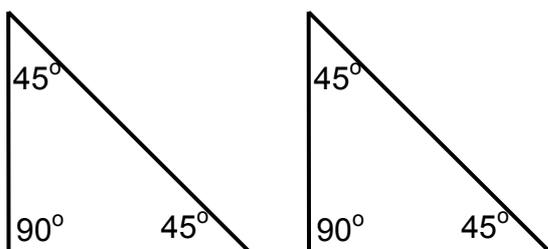

## Summary

The Tangram triangles are called right-angled isosceles triangles.

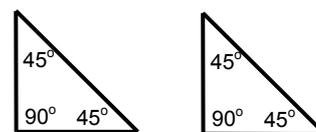

They are called **similar** triangles because each triangle has  $90^\circ$ ,  $45^\circ$  and  $45^\circ$  for its angles. (Their shapes are the same but their sizes differ).

However in the case of the two big triangles or the two small triangles, the angles **and** the sides are the same. These pairs are identical or **congruent** to each other.

An identical or **congruent** pair

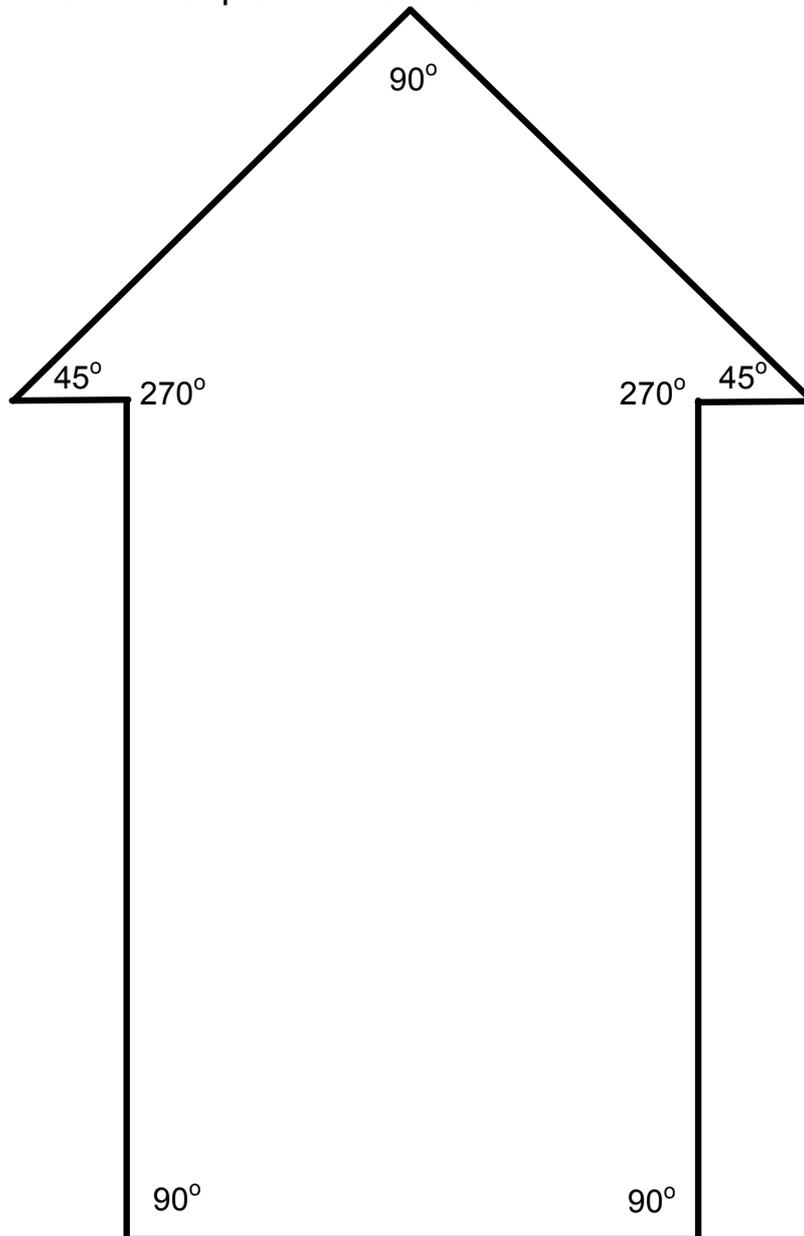

An identical or **congruent** pair

## Example

First form the shape shown below using the 7 Tangram pieces. Then, show what the internal angles are at each vertex. (A vertex is found where two lines meet each other).

Note: You may place the pieces on the shape below and then remove them before writing in the angles.

**Exercise 10** Answer the questions that follow.

1. How many right angles are there in this figure? \_\_\_\_\_
2. How many reflex angles are there? \_\_\_\_\_
3. How many acute angles are there? \_\_\_\_\_
4. What is the sum of all the angles in the figure? \_\_\_\_\_

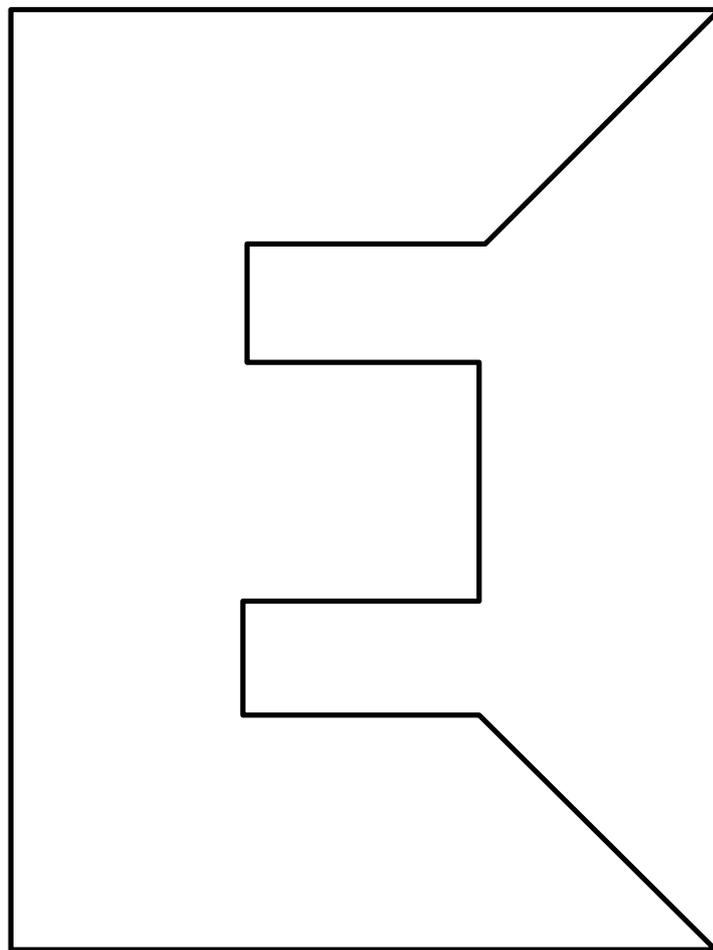

## Exercise 11

First form the shape shown below using the 7 Tangram pieces.

Then, show what the internal angles are at each vertex. (A vertex is found where two lines meet each other).

Note: You may place the pieces on the shape below and then remove them before writing in the angles.

Answer the questions that follow (Consider only the interior angles).

1. How many right angles are there in this figure? \_\_\_\_\_
2. How many obtuse angles are there? \_\_\_\_\_
3. How many acute angles are there? \_\_\_\_\_
4. How many reflex angles are there? \_\_\_\_\_
5. The number of horizontal parallel lines is \_\_\_\_\_
6. The number of vertical parallel lines is \_\_\_\_\_

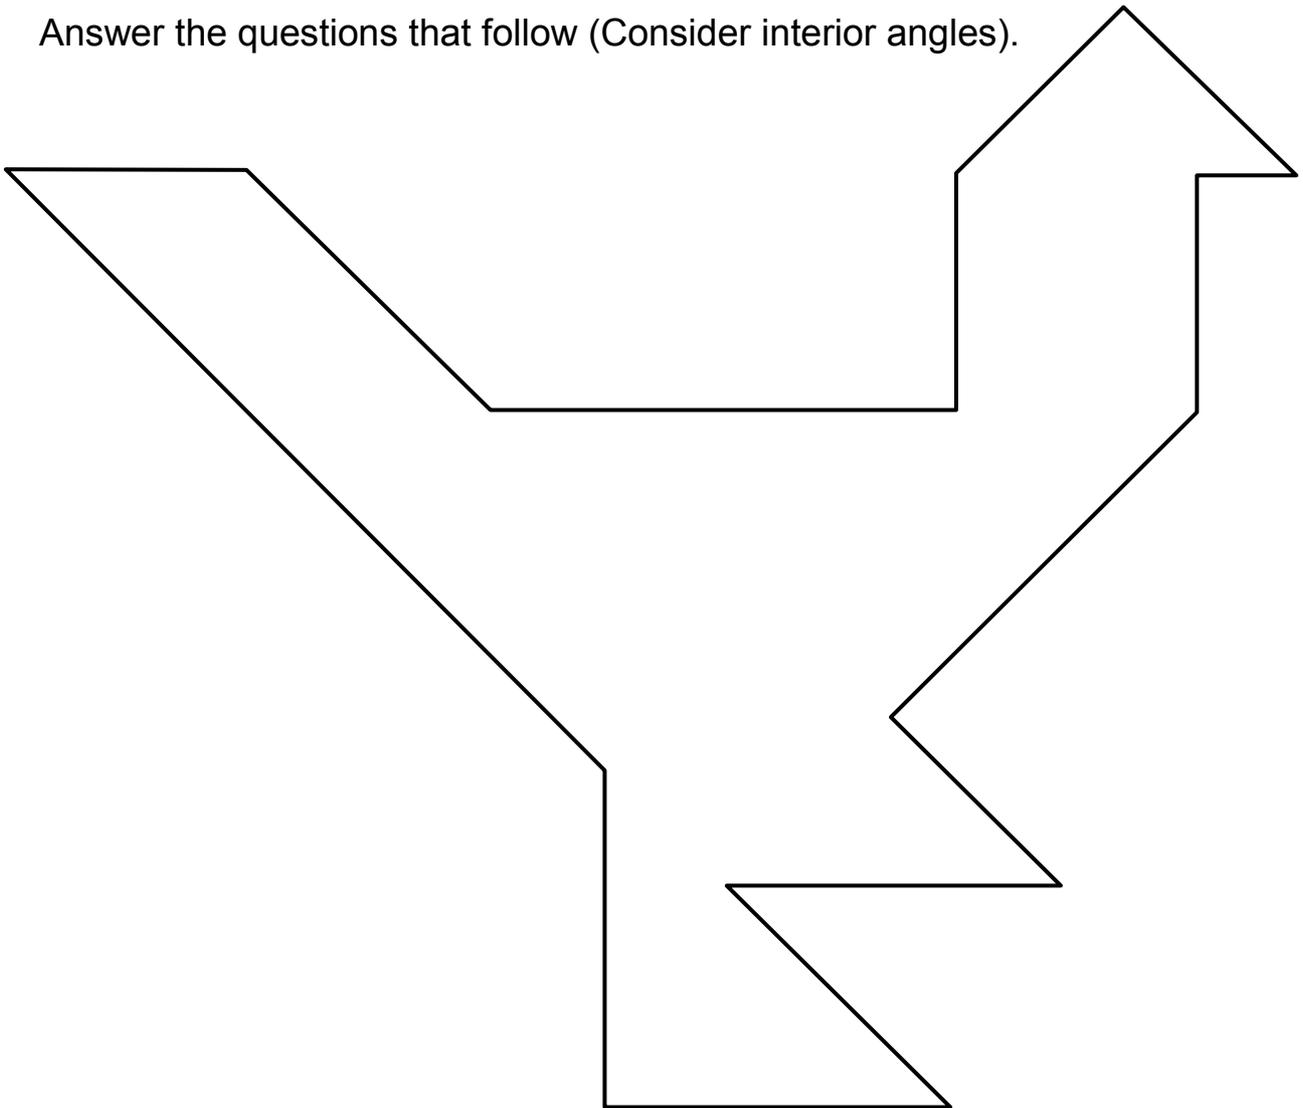

## Exercise 12

First form the shape shown below using the 7 Tangram pieces.

Then, show what the internal angles are at each vertex. (A vertex is found where two lines meet each other).

Note: You may place the pieces on the shape below and then remove them before writing in the angles.

Answer the questions that follow (Consider interior angles).

1. How many right angles are there in this figure? \_\_\_\_\_
2. How many obtuse angles are there? \_\_\_\_\_
3. How many acute angles are there? \_\_\_\_\_
4. How many reflex angles are there? \_\_\_\_\_
5. The number of horizontal parallel lines is \_\_\_\_\_
6. The number of vertical parallel lines is \_\_\_\_\_

## Tesselations (Using a grid)

A **tessellation** is an arrangement of (one or more) shapes which fit together to fill a space.

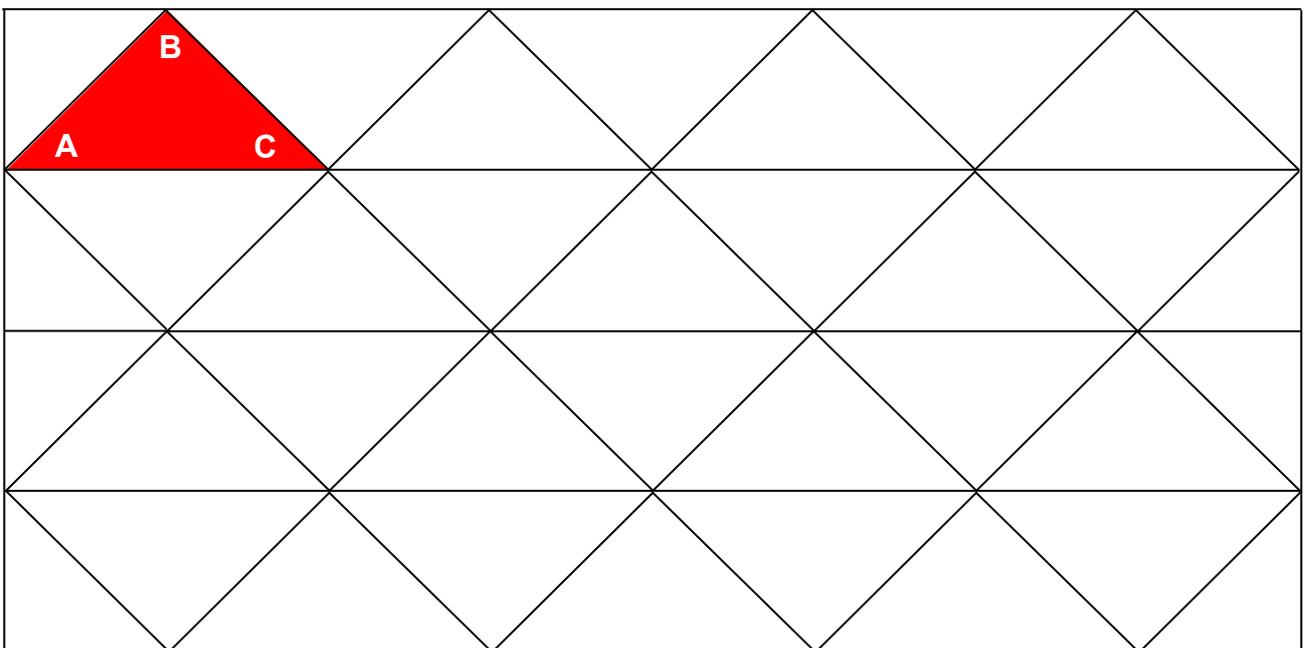

A **tiling** is a tessellation in 2-dimensional space which uses only a single repeated shape.

In the exercise that follows we shall investigate some of the properties of the Tangram shapes.

### Exercise 13

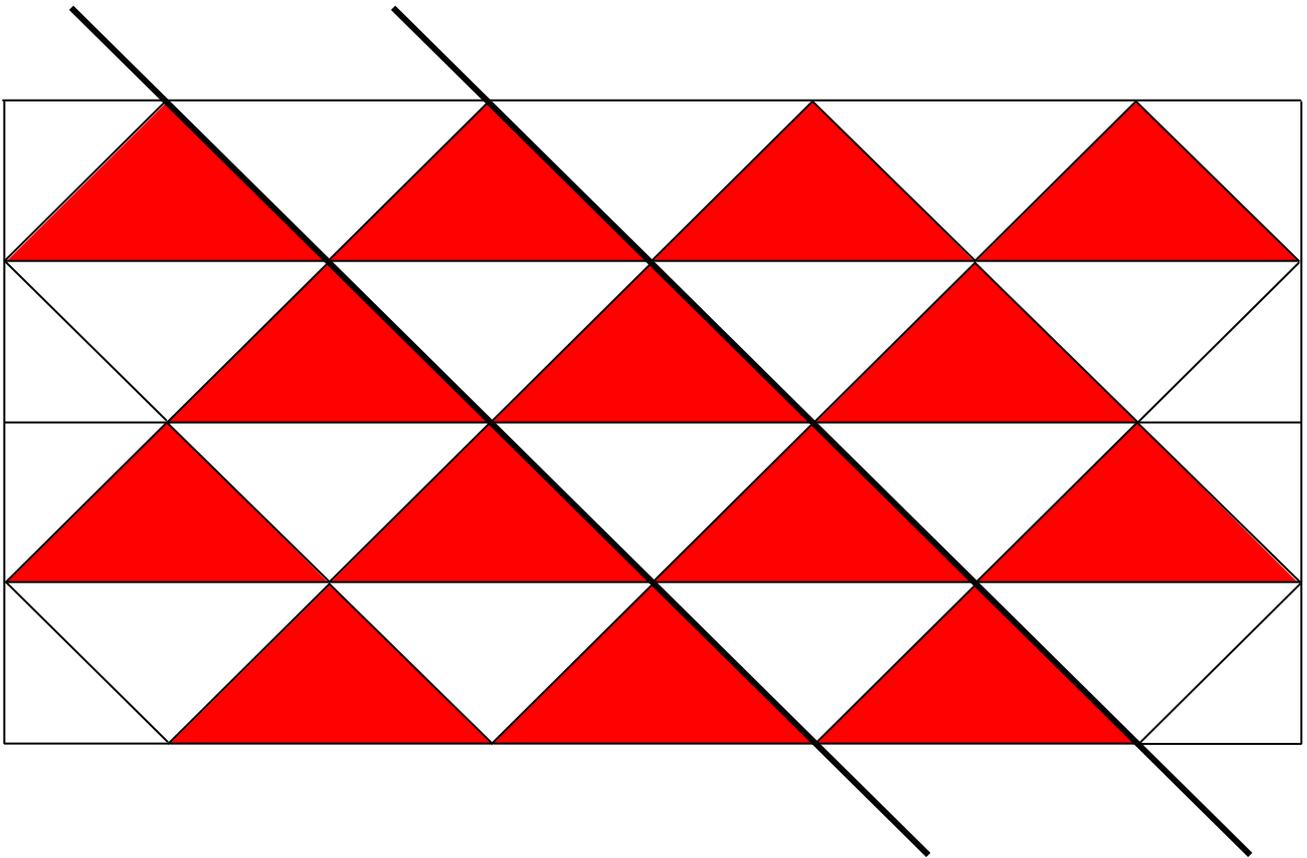

Place one small red triangle over the triangle marked ABC as shown below.

1. How many red triangles would you need to cover the grid? (You may leave out the four corners because they are smaller triangles). \_\_\_\_\_

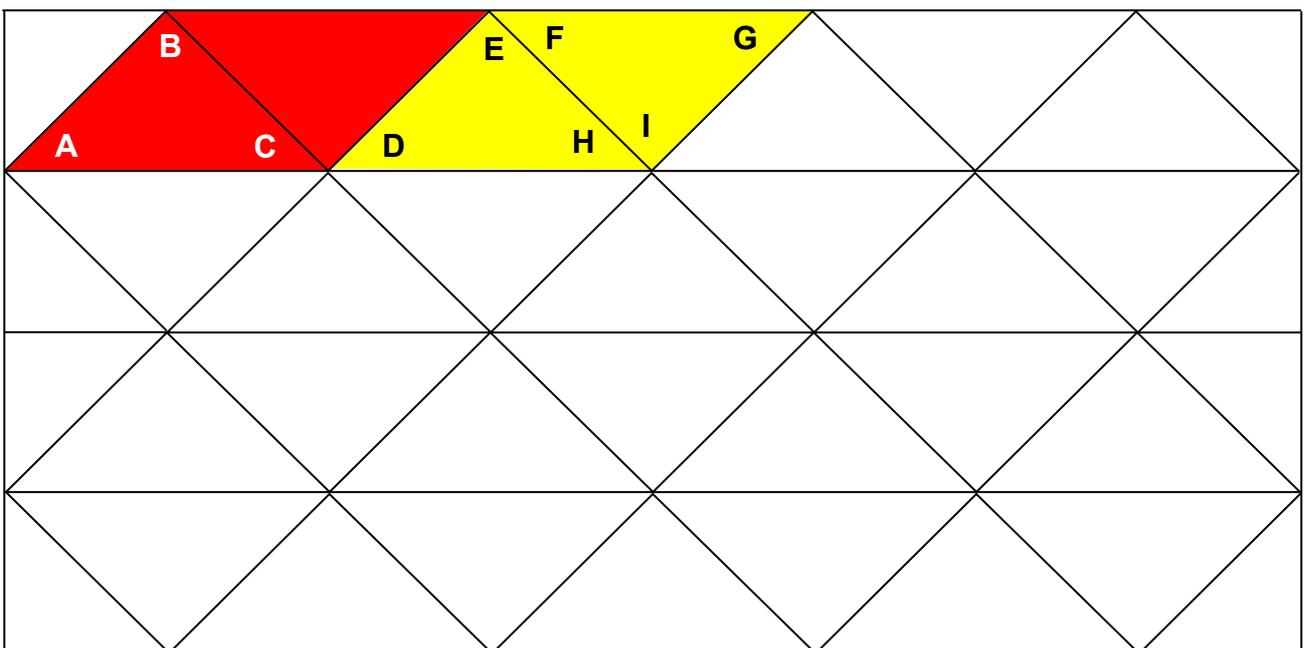

2. How many horizontal lines are there? \_\_\_\_\_
3. How many lines, sloping up from left to right ↗ are there? \_\_\_\_\_
4. How many lines, sloping down from left to right ↘ are there? \_\_\_\_\_
5. What is the special word used to describe lines like these: ↗ ↗ ↗  
(i.e. lines which never meet) \_\_\_\_\_

Notice that if we place triangles as shown below, the sides begin to form parallel lines. Two parallel lines are shown but in fact there are many more.

**Exercise 14**

Next place two red triangles and the parallelogram as shown below.

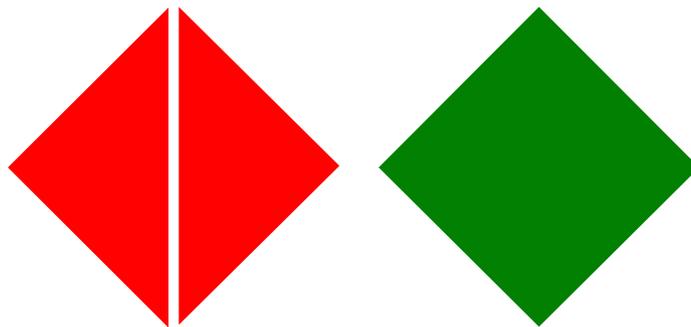

1. What can we say about the area of the parallelogram compared with two red squares? \_\_\_\_\_
2. How would you describe the area of the parallelogram compared to one red triangle? \_\_\_\_\_

**Let us investigate the angles now.**

3. What are the sizes of the angles of the isosceles triangle?

$$\hat{A} = \text{_____} \quad \hat{B} = \text{_____} \quad \hat{C} = \text{_____}$$

One method to check your answers is to take the square and two red triangles and place them as follows: (The four acute angles must all be equal)

4. Having worked out the sizes, what will the sum of  $\hat{E}$  and  $\hat{F}$  be? \_\_\_\_\_
5. To check the angles of the parallelogram, we can **spin** or **rotate** the shape through a half turn ( $180^\circ$ ). What are the sizes of  $\hat{D}$  and  $\hat{G}$ ? \_\_\_\_\_
6. What are the sizes of  $\hat{E}$  and  $\hat{F}$  as well as  $\hat{H}$  and  $\hat{I}$ ? \_\_\_\_\_
7. What conclusion can you make about the opposite angles of the parallelogram? \_\_\_\_\_
8. Finally, write down an important property about the opposite sides of a parallelogram. \_\_\_\_\_

(Half spin the parallelogram to double check your answer)
